This new edition in Barron's Easy Way Series contains everything students need to prepare for an algebra class. Algebra 2: The Easy Way provides key content review and practice exercises to help students learn algebra the easy way. Topics covered in this detailed review of algebra include linear functions, absolute value functions, polynomial operations, quadratic functions, complex numbers, functions and relations, polynomial functions, radicals, rational functions, exponential functions, logarithmic functions, series and sequences, and statistics and modeling. Practice questions at the end of each chapter help students develop their skills and gauge their progress. Visual references including charts, graphs, diagrams, instructive illustrations, and icons help engage students and reinforce important concepts. The previous edition of this book was titled E-Z Algebra 2.

In recent years, funding agencies like the Institute of Educational Sciences and the National Science Foundation have increasingly emphasized large-scale studies with experimental and quasi-experimental designs looking for 'objective truths'. Educational researchers have recently begun to use large-scale studies to understand what really works, from developing interventions, to validation studies of the intervention, and then to efficacy studies and the final "scale-up" for large implementation of an intervention. Moreover, modeling student learning developmentally, taking into account cohort factors, issues of socioeconomic, local political context and the presence or absence of interventions requires the use of large data sets, wherein these variables can be sampled adequately and inferences made. Inroads in quantitative methods have been made in the psychometric and sociometric literatures, but

these methods are not yet common knowledge in the mathematics education community. In fact, currently there is no volume devoted to discussion of issues related to large-scale studies and to report findings from them. This volume is unique as it directly discusses methodological issue in large-scale studies and reports empirical data from large-scale studies.

Educational sociologists have paid relatively little attention to children in middle childhood (ages 6 to 12), whereas developmental psychologists have emphasized factors internal to the child much more than the social contexts in explaining children's development. Children, Schools, and Inequality redresses that imbalance. It examines elementary school outcomes

(e.g., test scores, grades, retention rates) in light of the socioeconomic variation in schools and neighborhoods, the organizational patterns across elementary schools, and the ways in which family structure intersects with children's school performance. Adding data from the Baltimore Beginning School Study to information culled from the fields of sociology, child development, and education, this book suggests why the gap between the school achievement of poor children and those who are better off has been so difficult to close. Doris Entwistle, Karl Alexander, and Linda Olson show why the first-grade transition—how children negotiate entry into full-time schooling—is a crucial period. They also show that events over that time have repercussions that echo throughout children's entire school careers. Currently the only study of this life transition to cover a comprehensive sample and to suggest straightforward remedies for urban schools, *Children, Schools, and Inequality* can inform educators, practitioners, and policymakers, as well as researchers in the sociology of education and child development.
