Helps clinicians to systematically look beyond the obvious to arrive at a correct diagnosis
Written specifically for both novice and experienced cardiovascular clinicians in acute care settings, this is the only resource to focus on the art of conducting an in-depth patient history. Too often, a patient will tell their first provider one thing, and their second provider another. Even when asked the exact same question, patients' stories can inexplicably change. Clinicians can save time, effort, and cost by parsing out conflicting patient histories by adopting a specific and detailed a line of questioning. If recorded accurately and interpreted correctly, comprehensive history alone can obtain a correct diagnosis without exhaustive and expensive evaluations. This book includes two clinical scenarios for chief complaints that cardiovascular

clinicians may see in their practice. Unpacking these scenarios challenge clinicians to look beyond the obvious and recognize atypical presentations. Each scenario dissects and then discusses the history and other pertinent patient information to illuminate subtle differences in the process of information gathering. With this breakdown, the clinician can then identify if the patient has an acute cardiovascular issue. Each chapter ends with a sample of “how to present the patient” to an MD or peer and describes common pitfalls and assumptions to avoid. Key Features: Focuses specifically on acute cardiovascular issues in acute care settings Referenced by chief complaint or consult questions Targets patient history portion of the work up Examines subtle differences between cardiac diagnosis vs. non-cardiac diagnosis based on how patient history is taken Highlights common errors in review of information using EMR vs. standard questioning

This book provides an in depth review of the current practice in treating elderly patients with coronary artery disease (CAD) as well as an update of the existing literature. It is intended to reflect the current science of elderly patients with stable angina, acute coronary syndromes and those patients who are forwarded for CABG procedures. Evidence in the elderly patient group is often limited and/or non-existent therefore the main challenge, even for further research, will be to define the role of geriatric preconditions and its impact on outcome. A second topic will be to clarify how, if ever, existing cardiological outcome values like mortality can be applied to elderly patients or if other values like improvement of functional status or quality of life are more suitable parameters to measure interventional success in elderly patients. The role of pharmacotherapy in advanced age has to be discussed. These topics will be embedded in epidemiological, pathophysiological and ethical aspects of interventional treatment of CAD in older age.

This book reviews all aspects of the diagnosis and management of heart disease in women, covering areas such as gender differences in metabolic syndrome, hypertension and atherogenesis. Gender differences in cardiovascular diseases are widespread, but while gender medicine takes into account the effects of sex and gender on the health of women and men, traditionally, women have been underrepresented in cardiovascular clinical trials, in management of different cardiac diseases and drug use. Gender Differences in the Pathogenesis and Management of Heart Disease deals with the gender-specific differences in cardiac physiology and diseases and brings into perspective the critical significance of gender in management of cardiovascular disease presentations and management. As such it is of enormous use to all clinical staff who manage women with cardiovascular disease.
