Per il secondo biennio degli Istituti Tecnici, settore Tecnologico, indirizzo Trasporti e Logistica. Il volume “Conoscere la LOGISTICA ambito aeronautico” è costituito da 10 moduli formativi e 33 unità didattiche organizzate in una parte introduttiva, una parte generale e una parte specifica relativa agli aspetti che più caratterizzano la logistica in ambito aeronautico. La parte introduttiva (unità didattiche da 1 a 4) presenta l’origine e l’evoluzione della logistica e il campo di applicazione della stessa, mettendo in risalto la trasversalità tipica della materia intesa non soltanto come il puro trasferimento fisico dei beni da un luogo a un altro, ma come l’organizzazione e la gestione di un insieme integrato di flussi, la parte introduttiva termina esponendo il concetto di approccio per processi e il funzionamento dei sistemi di gestione per la qualità. La parte generale (unità didattiche da 5 a 15) mette a confronto le diverse tipologie di trasporto in ottica di intermodalità, introduce il concetto di unità di carico e le tecniche di caricamento e movimentazione in sicurezza del carico, descrive tutte le infrastrutture attualmente a disposizione della logistica, i ruoli, le competenze e le responsabilità delle diverse figure professionali che le gestiscono o ne utilizzano i servizi, presenta gli aspetti giuridici nazionali, comunitari e internazionali, nonché gli aspetti amministrativi e assicurativi che regolano la gestione in sicurezza del trasporto e la distribuzione delle merci anche pericolose, compresa la documentazione, i modelli e le procedure utilizzate nella pratica quotidiana. La parte specifica (unità didattiche da 16 a 33) identifica e descrive la struttura e i componenti principali del mezzo aereo, nonché le tecniche di gestione e programmazione della manutenzione, presenta le diverse tipologie di traffico aereo e i relativi sistemi di assistenza, sorveglianza e monitoraggio, descrive i principi che regolano la struttura e la gestione aeroportuale e le infrastrutture a servizio del trasporto aereo, compresa la relativa documentazione coerente con le normative sulla sicurezza, descrive le tecniche di carico e scarico dell’aeromobile, del trasporto aereo delle merci pericolose e di gestione dei flussi dei passeggeri in partenza, transito e arrivo, la parte si conclude con lo studio dei differenti sistemi produttivi, degli aspetti di contabilità industriale, delle tecniche di gestione degli approvvigionamenti e delle scorte, dei principi di gestione della salute e della sicurezza sui luoghi di lavoro secondo le normative vigenti.

This compilation probably looks like one of the craziest things a human being could spend his or her time on. Yet nobody would wonder at someone taking a short walk every day - after twenty five years that person would have covered a surprisingly long distance. This is exactly the story behind this list, which appeared first as a few pages within the

directory StarGuides (or whatever name it had at that time) and as a distinct sister publication since 1990. The idea behind this dictionary is to offer astronomers and related space scientists practical assistance in decoding the numerous abbreviations, acronyms, contractions and symbols which they might encounter in all aspects of the vast range of their professional activities, including traveling. Perhaps it is a bit paradoxical, but if scientists quickly grasp the meaning of an acronym solely in their own specific discipline, they will probably encounter more difficulties when dealing with adjacent fields. It is for this purpose that this dictionary might be most often used. Scientists might also refer to this compilation in order to avoid identifying a project by an acronym which already has too many meanings or confused definitions. The key principle of systems engineering is that an aircraft should be considered as a whole and not as a collection of parts. Another principle is that the requirements for the aircraft and its subsystems emanate from a logical set of organized functions and from economic or customer-oriented requirements as well as the regulatory requirements for certification. The resulting process promises to synthesize and validate the design of aircraft which are higher in quality, better meet customer requirements and are most economical to operate. This book is more of a how and a why guide rather than a what guide. It stresses systems engineering is an integrated technical-managerial process that can be adapted without sacrificing quality in which risk handling and management is a major part. It explains that the systems view applies to both the aircraft and the entire air transport system. The book emphasizes that system engineering is not an added layer of processes on top of the existing design processes; it is the glue that holds all the other processes together. The readership includes the aircraft industry, suppliers and regulatory communities, especially technical, program and procurement managers; systems, design and specialty engineers (human factors, reliability, safety, etc.); students of aeronautical and systems engineering and technical management; and government agencies such as FAA and JAA.

Do you know the meaning of the following acronyms? How many of these can you identify? EPA, OSFR, NIOSHTIC, SHEEP, CISDDOC, SFIREG, SPALD, HSELINE, SGOMSEC, OSPED, MHIDAS, STALAPCO, OPPTS, SNRE, PRISMA, OPP-SRRD, SWDSCMA, OTAG, SOLAGRAL, OPPT-EETD, PFEER, OSTZ, OSSF, PEACE, OPP-BPPD, PACE, OW-AIEO, PARIS, PECSQA, PHHVAS, REED, PERI, VON, RTECS, PNUE, WAS, VCE, WBMEPD, UWQRPPSC, USAPEHEA, OTSB, TEOTWAWKI, TRIFID, and finally TYVM for buying this book. How many did you know for sure? The answers are contained in this book. If you knew all of these, you are an expert, but this book can still help you. If you knew about half, you are good, and this book can be very helpful. If you only knew a few, this book is absolutely necessary. Again, TYVM. This book can be a great source of enjoyment, entertainment and games. This book is an excellent source of acronyms and abbreviations for guessing games. The present report concerns intermodal transport, with a particular focus on the role of railways and of transport documents computerization towards the development of sustainable intermodal transport and the implementation of the sustainable development goals. It takes advantage of the workshop on Railways, intermodal transport and the computerization of transport documents held in Geneva on 23 November 2017 during the 60th session of the Working Party on Intermodal Transport and Logistics (WP.24). Therefore, several case studies and good practices are included and analysed as well as concrete conclusions and recommendations are proposed.

TRB's National Cooperative Highway Research Program (NCHRP) Synthesis 402: Construction Manager-at-Risk Project Delivery for Highway Programs explores current methods in which state departments of transportation and other public engineering agencies are applying construction manager-at-risk (CMR) project delivery to their construction projects. CMR project delivery is an integrated team approach to the planning, design, and construction of a highway project, to help control schedule and budget, and to help ensure quality for the project owner. The team consists of the owner; the designer, who might be an in-house engineer; and the at-risk construction manager. The goal of this project delivery method is to engage at-risk construction expertise early in the design process to enhance constructability, manage risk, and facilitate concurrent execution of design and construction without the owner relinquishing control over the details of design as it would in a design-build project.
