Perfect for high school and college students and anyone interested in Human Anatomy & Physiology.

The introduction to anatomy and physiology continues as students are given a deeper understanding of God's wonderful design of their bodies. How do just the correct muscles know how to contract in just the right way to allow us to walk? How can we control the movements of our hands in a very precise fashion so that we can brush our teeth? How can we decipher those funny marks on a printed page, understand that they are letters and punctuation marks, and make sense of them? How can we hear others singing and make our voices match theirs? How does the cereal you had for breakfast become energy? Or the popcorn you had at the ballgame? How does the chicken you had for supper provide the amino acids the body needs to build proteins? These questions and more are answered as we look into the wonders of God's awesome creation, which can only be truly understood as a product of the Master Designer. FEATURES: The calendar provides 5 lessons weekly with clear objectives, and the worksheets, quizzes, and tests are all based on the readings from the two books.

The average person eats about 100,000 pounds of food during his lifetime. Have you ever considered what happens in the body to make use of all those grains, meats, and vegetables plus all those fun sweets? Did you know that your stomach produces hydrochloric acid, and your colon harbors more than 400 distinct species of helpful bacteria? The adult digestive system is amazing. The digestive tract itself is 20-30 feet long. It takes about two hours for food to be rhythmically propelled through this system, during which carbohydrates, proteins, fats, vitamins, minerals, and water pass through the intestinal wall and into the bloodstream. Accessory glands such as the pancreas, liver, and salivary glands aid in the digestive process and the utilization of food to make the fuel that the body uses for growth and metabolism. Join Dr. Menton as he uses computer graphics and anatomy models to reveal intriguing facts that inspire you to eat properly and to give glory to Christ the Creator! Part 1: 37 mins. Part 2: 37 mins."

This book offers one of the most comprehensive reviews in the field of gastrointestinal (GI) physiology, guiding readers on a journey through the complete digestive tract, while also highlighting related organs and glandular systems. It is not solely limited to organ system physiology, and related disciplines like anatomy and histology, but also examines the molecular and cellular processes that keep the digestive system running. As such, the book provides extensive information on the molecular, cellular, tissue, organ, and system levels of functions in the GI system. Chapters on the roles of the gut as an endocrine, exocrine and neural organ, as well as its microbiome functions, broaden readers' understanding of the multi-organ networks in the human body. To help illustrate the interconnections between the physiological concepts, principles and clinical presentations, it outlines clinical examples such as pathologies that link basic science with clinical practice in special "clinical correlates" sections. Covering both traditional and contemporary topics, it is a valuable resource for biomedical students, as well as healthcare and scientific professionals.

A typical human anatomy and physiology textbook contains over one thousand pages and weighs over six pounds. It is not conducive to quick study or a last-minute review when a student is trying to prepare for exams or class lectures. The author has carefully reviewed the major human anatomy and physiology textbooks and incorporated into this guide the main concepts needed by students to meet the challenges of the course and make the grades they need. These points are provided in bulleted lists for quick mastery of the subject matter. The information is provided on each of the following topics and many more: Anatomy terms and physiology concepts Chemistry, including organic and inorganic Cellular level of organization Cardiovascular system Circulatory system Digestive system Immune system Nervous system Nutrition, metabolism, and body temperature regulation Fluid, Electrolytes, and Acid-base balance Human Anatomy and Physiology will help medical, nursing, and students of other health-related disciplines prepare for their classes and exams by providing review questions at the end of every chapter, along with the answers that will enable them to test their knowledge and skill level.

Chemical Zoology Volume V Arthropoda Part A presents chemical information on zoological importance of Arthropoda. It is composed of 12 chapters that cover anatomy, feeding, and digestion; carbohydrate, nitrogen, and lipid metabolism; osmoregulation; and growth and development. After briefly dealing with general characteristics, evolution and classification of Arthropoda, the book discusses arthropod nutrition and the nutrients needed for their growth and development. It describes the unique features of the digestive system, as well as secretion, resorption, and production of digestive juices of arthropods and crustaceans. Other chapters deal with the aspects and dynamics of arthropods' carbohydrate, lipid, and nitrogen metabolism. The book also describes the mechanism of osmotic regulation in aquatic arthropods and the role of amino acids in this function in insect hemolymph. The concluding chapters discuss some of the metabolic changes as related to tissue growth and an increase in body size in arthropods. This book is an invaluable resource for zoologists and biochemists.

The fourth volume of the Wonders of the Human Body series dives deep into why our bodies need energy and how we get it. As with all our explorations into the complexity of the human body, when you see the incredible design of the digestive system, you ultimately have to ask yourself, "Can this all possibly be an accident? Something that happened by chance?" The answer is a resounding, "No!" We are not the product of evolution. We are not animals. We are a special creation. In Digestive System & Metabolism, you will learn about: The digestive system—including the teeth and tongue, the mouth and esophagus, the stomach and intestines, the liver, the gallbladder, and the pancreas Our metabolism—a complex system created by God to transform food into fuel for our energy God our Designer thought of everything, even the problems that would occur in a sin-cursed world. We are indeed wonderfully made. Prepare to be amazed!

Aristotle in the *Historia animalium*, (Book IV) gives one of the earliest descriptions of the anatomy of the cephalopod digestive tract, comparing it to that of other molluscs. From dissections of cuttlefish several key features of the cephalopod digestive tract were described: the beak ("teeth") and radula ("tongue"), the passage of the oesophagus through the brain en route to the crop and stomach. The stomach is described as having spiral convolutions like a trumpet snail shell suggesting that the structure described is actually the caecum. The gut then turns anteriorly so that the anal opening is near the funnel leading a modern author to comment that they "defaecate on their heads" (Leroi, 2014). In the intervening two millennia research on the cephalopod digestive tract has been sporadic with much of the current knowledge arising from a series of studies in the 1950s to the 1970s by A.M. Bidder, E. Boucaud-Camou, R. Boucher-Rodoni and K. Mangold which established the basic mechanisms of digestion and absorption (e.g., Bidder, 1950; Boucaud-Camou et al., 1976). The last 10 years has seen a resurgence of research on the digestive tract stimulated by interest cephalopods (particularly *Octopus vulgaris* and *Sepia officinalis*) as candidate species for aquaculture and the potential impact of climate change on cephalopod ecology. Additionally, the inclusion of cephalopods in the European Union legislation regulating scientific research has necessitated improved understanding of dietary requirements and metabolism as well as the development of methods to monitor digestive tract function to ensure optimal care and welfare in the laboratory. Prompted by this resurgence of interest in the cephalopod digestive tract and an international workshop on the topic held in November 2015 we have collected a series of papers reflecting the current state-of-the art. The seventeen papers in this book combine original research publications and reviews covering a diversity of topics that are grouped under four main themes reflecting key topics in the physiology and ecology of the cephalopod digestive tract; feeding strategies, early life stages and aquaculture, anatomy and digestive physiology, care and welfare. This book provides a timely synthesis of ongoing research into the cephalopod digestive tract which we hope will stimulate further studies into this relatively neglected aspect of cephalopod biology.
