By asking how well theological views of human nature stand up to the discoveries of modern science, Alan Olding re-opens the question of whether the "design" argument for the existence of God is fatally undermined. A distinctive feature of the work is its emphasis on the metaphysical implications of biology and how these at times conflict with other, more plausible metaphysical positions. Another is its close critical examination of the "design" argument and of the relation God has to the world he creates. "Modern Biology and Natural Theology" takes up issues currently of concern to many thinkers and will provide fascinating reading for anyone interested in philosophical problems, particularly the impact of Darwinism on natural theology.

The book presents a new science of semiotic linguistics. The goal of semiotic linguistics is to discover what characterizes language as an intermediary between the mind and reality so that language creates the picture of reality we perceive. The cornerstone of semiotic linguistics is the discovery and resolution of language antinomies -contradictions between two apparently reasonable principles or laws. Language antinomies constitute the essence of language, and hence must be studied from both linguistic and philosophical points of view. The basic language antinomy which underlies all other antinomies is the antinomy between meaning and information. Both generative and classical linguistic theories are unaware of the need to distinguish between meaning and information. By confounding these notions they are unable to discover language antinomies and confine their research to naturalistic description of superficial language phenomena rather than the quest for the essence of language.(Series A)

Written by over 60 scientists and clinicians from the United States, mainland China, Germany, Australia, Japan, Sweden, Portugal and Hong Kong, *Current Research in Acupuncture* discusses recent advances in acupuncture research in a modern scientific language. The first 5 chapters investigate the basic mechanisms of acupuncture. Later chapters explore topics including acupuncture treatment and potential mechanisms for epilepsy, Parkinson's diseases, neurodegenerative disorders such as Alzheimer's disease, vascular cognitive impairment, aging, anxiety, polycystic ovary syndrome, pain, nerve root cervical spondylosis, stroke, inflammation, myocardial ischemia and other cardiovascular diseases. Following the translational and clinical discussions, 4 chapters present new prospects for acupuncture theories and applications. The final chapter comments on the pitfalls and problems of the previous studies and suggests direction for future research towards in-depth understanding of acupuncture, along with better application of acupuncture in modern medicine. Each chapter is written by one or more experts in the field. This unique book provides a broad

perspective on the principles of acupuncture for acupuncture researchers and neuroscientists. The laboratory and clinical investigations of various acupoints and optimal conditions provide unique clues to acupuncturists for improved clinical efficacy. For a medical student, this book is a modern course in ancient Traditional Chinese Medicine, especially acupuncture. Ying Xia, the chief editor, is Professor and Vice-Chairman of the Department of Neurosurgery at The University of Texas Medical School in Houston, Texas, USA. Guanghong Ding is Professor in the Department of Mechanics and Engineering Science at Fudan University and Director of Shanghai Research Center for Acupuncture and Meridians, Shanghai, China. Gen-Cheng Wu is Professor of Neurobiology; Chairman, Department of Integrative Medicine and Neurobiology; Director, Institute of Acupuncture Research; and Director, WHO Collaborating Center for Traditional Medicine, at Shanghai Medical College of Fudan University, Shanghai, China.

Written by experts in both mathematics and biology, Algebraic and Discrete Mathematical Methods for Modern Biology offers a bridge between math and biology, providing a framework for simulating, analyzing, predicting, and modulating the behavior of complex biological systems. Each chapter begins with a question from modern biology, followed by the description of certain mathematical methods and theory appropriate in the search of answers. Every topic provides a fast-track pathway through the problem by presenting the biological foundation, covering the relevant mathematical theory, and highlighting connections between them. Many of the projects and exercises embedded in each chapter utilize specialized software, providing students with much-needed familiarity and experience with computing applications, critical components of the "modern biology" skill set. This book is appropriate for mathematics courses such as finite mathematics, discrete structures, linear algebra, abstract/modern algebra, graph theory, probability, bioinformatics, statistics, biostatistics, and modeling, as well as for biology courses such as genetics, cell and molecular biology, biochemistry, ecology, and evolution. Examines significant questions in modern biology and their mathematical treatments Presents important mathematical concepts and tools in the context of essential biology Features material of interest to students in both mathematics and biology Presents chapters in modular format so coverage need not follow the Table of Contents Introduces projects appropriate for undergraduate research Utilizes freely accessible software for visualization, simulation, and analysis in modern biology Requires no calculus as a prerequisite Provides a complete Solutions Manual Features a companion website with supplementary resources
