The pendulum is a universal topic in primary and secondary schools, but its full potential for learning about physics, the nature of science, and the relationships between science, mathematics, technology, society and culture is seldom realised. Contributions to this 32-chapter anthology deal with the science, history, methodology and pedagogy of pendulum motion. There is ample material for the richer and more cross-disciplinary treatment of the pendulum from elementary school to high school, and through to advanced university classes. Scientists will value the studies on the physics of the pendulum; historians will appreciate the detailed treatment of Galileo, Huygens, Newton and Foucault's pendulum investigations; psychologists and educators will learn from the papers on Piaget; teachers will welcome the many contributions to pendulum pedagogy. All readers will come away with a new awareness of the importance of the pendulum in the foundation and development of modern science; and for its centrality in so many facets of society and culture.

The use of the cognitive interviewing method for survey question testing has proliferated and evolved over the past 30 years. In more recent years the method has been applied to the evaluation of information letters and leaflets and to research consent forms. This book provides a practical handbook for implementing cognitive interviewing methods in the context of applied social policy research, based on the approach used by the authors at the NatCen Social Research (NatCen) where cognitive interviewing methods have been used for well over a decade. The book provides a justification for the importance of question testing and evaluation and discusses the position of cognitive interviewing in relation to other questionnaire development and evaluation techniques. Throughout the book, the focus is on providing practical and hands-on guidance around elements such as sampling and recruitment, designing probes, interviewing skills, data management and analysis and how to interpret the findings and use them to improve survey questions and other documents. The book also covers cognitive interviewing in different survey modes, in cross national, cross cultural and multilingual settings and discusses some other potential uses of the method.

Assessment has long been recognized as a key feature in learning efficacy, especially through formative evaluation. Item banking, the storage and classification of test items, is an essential part of systematic assessment. This volume is based on a NATO Advanced Research Workshop held as part of the Special Programme on Advanced Educational Technology. The workshop brought together scholars from around the world to discuss and critically analyze the issues and problems associated with Subjective Probability Measurement (SPM) or the more generic research area called self-assessment. Recent advances in computer technology (expert systems, interactive video disks, and hypermedia) along with the developing sophistication of self-assessment scoring systems based on SPM made this conference particularly important and timely. The book is divided into three main parts: - The input: item banking and hypermedia - The process: subjective probabilities - The output: teaching and learning feedbacks. In summary, although SPM is a difficult theoretical concept for most educators to comprehend, the sophisticated nature of modern computer systems coupled with comprehensive formative and summative evaluation and self-assessment systems make SPM transparent to the user.
