This volume presents the knowledge, views, and experiences of experts in the fields of health care that are particularly important to women. Not all of the authors agree on all of the issues, but all share the same concerns about women's health and recognize the importance of providing information to enable women to become active participants in the health care partnership. The idea for the book evolved from our own work in the

field of women's health care. The positive responses we received to several papers and presentations based on our experiences and addressed to patients, physicians, and other health care professionals indicated that there is a growing need for open discussion of women's health care issues as well as a need for developing and implementing new and better ways of dealing with these issues. We were further motivated by the repeated failure of the health care community to integrate new insights and information (that frequently contradict older, established beliefs and practices) into current health planning, education, and practice.

Ultrasound is the backbone of modern obstetric and gynecology practice. Recent technological breakthroughs in diagnostic ultrasound, including the advent of color Doppler, power Doppler, three-dimensional and four dimensional imaging, have led ultrasound to surpass the expectations of Ian Donald, its visionary father. The text is divided into three parts general aspects, obstetrics, and gynecology. The first and second textbooks were successful in this endeavor, but with the explosion of knowledge, it was clear that an expanded and updated third edition would be invaluable. Section one deals with a variety of topics that lay the

foundation for the rest of the book. Section two addresses the myriad subtopics in obstetric ultrasound that optimize the care of pregnant women and fetal patients. The last section addresses the essential role that ultrasound plays in the many dimensions of clinical gynecology.
