Developmental Guide for Medical Students provides medical students with a much easier and more comprehensive way to learn and understand human gross anatomy by combining state-of-the-art knowledge about human anatomy, evolution, development, and pathology in one book. The book adds evolutionary, pathological, and developmental information in a way that reduces the difficulty and total time spent learning gross anatomy by making learning more logical and systematic. It also synthesizes data that would normally be available for students only by consulting several books at a time. Anatomical illustrations are carefully selected to follow the style of those seen in human anatomical atlases but are simpler in their overall configuration, making them easier to understand without overwhelming students with visual information. The book's organization is also more versatile than most human anatomy texts so that students can refer to different sections according to their own learning styles. Because it is relatively short in length and easily transportable, students can take this invaluable book anywhere and use it to understand most of the structures they need to learn for any gross anatomy course.

This invaluable manual is intended to guide and facilitate human anatomical dissections. It is flexible enough for use in long as well as short courses, and is thus structured in such a way that the dissection of the body can be completed in 110 to 160 hours. Although some medical schools have reduced the amount of dissection, the North American schools have lengthened their courses. The manual can also be used in those courses where only part of the body is dissected and even in the study of prosected material. It can be particularly useful as a link with real anatomy when used together with computerised-anatomy programs; many curricula emphasise that the student should go back and forth between the body and computer programs. The guide is also useful where students do not dissect but merely look at atlases, prosections and models, by providing a link to real, living and variable anatomy. Nowadays many anatomy courses are aimed solely at systems anatomy. Although important as systems are, regions are clinically vital since many more problems concern damage to several systems because the lesions are regional. This is where the guide is of considerable help. There is an introduction for each anatomical region; and for each section to be dissected there is an overview, a dissection schedule which guides the student through a set of instructions, a summary and a list of

objectives that are clinically important. The terminology used is the latest. This manual is suitable for medical, dental, osteopathy and chiropody schools as well as human biology and science programs that include dissection in their undergraduate gross anatomy course. It is also of value for advanced knowledge of anatomy for surgery as required by further qualifications and in relation to specialised training involving interpretation of normal anatomy in non-invasive imaging of anatomy for clinical diagnosis, practice of clinical (surgical) skills on cadaveric material, and in discussions about clinical problems. (1998). The major aim of this guide remains ? to provide a well-rounded dissecting manual that reinforces, but does not replace, a textbook of human anatomy. The details of human anatomy covered here are of interest and importance primarily in a medical context. To this end the guide has been designed for medical, dental, osteopathy and physiotherapy students, and for students of alternative medicine where dissection of the human body is required. It has also been planned for postgraduate students proceeding to specialise in the various clinical (surgical, radiological, emergency medical, and gynaecological) sciences and thus need to revise their anatomical knowledge through dissection. It has to be stressed, learning anatomy is most efficient and retention is highest when didactic study is combined with the experience of dissection. In using this method one observes, palpates and moves parts of the body. It is a three-dimensional and visuo-tactile approach to the examination of the human body. Undoubtedly dissection reinforces and expands the knowledge gained from the textbook and from atlases and computerized-anatomy programs, The Guide is flexible enough for use in long as well as short courses, and is thus structured in such a way that the dissection of the body can be completed in 100 to 160 hours. It provides a link to real, living and variable anatomy.
