Ready-to-build 8051 microcontroller projects--at your fingertips. Probably the most successful microcontroller on the market today, Intel's legendary 8051 lives on in enhanced versions sold by more than 20 chip manufacturers. Packed with over 30 experiments using Dallas Semiconductor's "HSM" flavors of the 8051 plus the Atmel AT89Cx051 "Flash" based versions, Myke Predko's *Programming and Customizing the 8051 Microcontroller* puts you in control of the 8051's architecture and instruction set--and even supplies a baker's dozen of ready-to-build example applications, programs and circuits. (You'll see how to create an Atmel AT89Cx061 programmer...a device emulator that exploits the 8051's ability to access external memory...a robot based on the Tamiya "Wall Hugging Mouse"--complete with a TV remote control interface...two real-time 8051 operating systems...and many other exciting projects). Best of all, the included CD-ROM supplies source code for the book's experiments and applications, a demonstration cop of the "UMPS" integrated development environment (IDE), and data sheets for the Dallas Semiconductor and Atmel 8051 compatible devices.

Mixed-Signal Embedded Microcontrollers are commonly used in integrating analog components needed to control non-digital electronic systems. They are used in automatically controlled devices and products, such as automobile engine control systems, wireless remote controllers, office machines, home appliances, power tools, and toys. Microcontrollers make it economical to digitally control even more devices and processes by reducing the size and cost, compared to a design that uses a separate microprocessor, memory, and input/output devices. In many undergraduate and post-graduate courses, teaching of mixed-signal microcontrollers and their use for project work has become compulsory. Students face a lot of difficulties when they have to interface a microcontroller with the electronics they deal with. This book addresses some issues of interfacing the microcontrollers and describes some project implementations with the Silicon Lab C8051F020 mixed-signal microcontroller. The intended readers are college and university students specializing in electronics, computer systems engineering, electrical and electronics engineering; researchers involved with electronics based system, practitioners, technicians and in general anybody interested in microcontrollers based projects.

This totally reworked book combines two previous books with material on networking. It is a complete guide to programming and interfacing the 8051 microcontroller-family devices for embedded applications.

This book uses a step-by-step approach to teach the fundamentals of assembly language programming and interfacing of the 8051 microcontroller. Simple, concise examples are utilized to show what action each instruction performs, then a sample is provided to show its application. For anyone interested in learning about the 8051 microcontroller.

The purpose of this book is to present the technology required to develop hardware and software for embedded controller systems at a fraction of the cost of traditional methods. Included in the book are hardware schematics of 8051 family development systems (single board and bussed 8051 microcontroller). Source code for both the 8086 and 805 family FORTH operating systems is published in the book. Binary images of the operating systems can be generated from the source code using the metacompiler also contained in the book. The book can be seen as a "toolbox" including all the necessary hardware and software information to be used in constructing 8051-based controller systems. Advanced Microcontroller trainer is an innovative idea in embedded systems projects. It includes replaceable Microcontrollers interface cards user can plug a card of his choice whether PIC, AVR or 8051 microcontroller and test his code. It facilitates Embedded system labs with Touch Screen and GSM Module. The trainer made in very low cost also reduces the overall project cost and implementation issues are addressed effectively. This project enlightened the importance of such equipment and effectively addressed the need of such useful and low cost projects. It should be noted that the Trainer's manufacturing requires accurate PCB design and soldering of the components. If possible already pressed double layer PCB's of fiber should be used to avoid any inconvenience. After going through the rigorous pressure of the workload and immense research the fruit of shear hard work and excellence has been achieved. Alhamdulillah the fabrication although not fully ideal has been completed. Going through the journey it was learned that limitations are always there to make your going hinder us and tough. High aims and untried efforts can help overcome the hurdles that encompass you way.
